

Bump online people threads to the top

Have you ever been on a forum waiting for people to reply to your threads? Do you find it frustrating to have to bump your own threads so you can get the response you're looking for? If yes, then you might want to look at this concept idea:

When you are online, varying from 5-10 of your "latest" post would be bumped to the top automatically as you are online. This would increase the chances of getting a reply to your messages. As well all know though, forums are being browsed by thousand of people so bumping all those threads all at once would be useless & cpu consuming that's why instead of bumping all of our threads, we would be able to bump 5 chosen thread each time we are online.

Doing so will help your own forum to grow as members who are online longer have better chances of getting replies and then to reply so more posts. The problem with current forums is that threads which aren't always done end up not being answered. Why not make sure all threads are getting the reply they should get? When a user is satisfied with the answer, he can remove the thread from his list => yes, this means we could ask for others people thread to get replied to.

Yet, this is only an idea. I'm sure that forums such as vBulletin and Invision Power Board will find this thread and will add it to their next release as people are avid of answers. By giving them a better opportunity to get their answer, community grows, people are happy, everyone's happy :).
