

# Slow network under WSL

When I started using WSL on Windows 11 I had slow network performance issues. We're talking running `speedtest-cli` and getting ~3 Mbps download speeds while my connection can reach 400 Mbps.

After searching online for a while and trying a variety of things I finally found a solution.

In `%USERPROFILE%\wslconfig` add the following:

```
[wsl2]
networkingMode=mirrored
```

With this fix applied I'm now getting ~400 Mbps download speeds in WSL, matching my native Windows performance.
